For Immediate Release

ALUM BANK, Pa. – Mission Critical Solutions, LLC, a company which provides industrial engineering, machining and fabrication services, recently renewed a three year, International Organization for Standardization (ISO) SRI Quality System certification following an audit in late September.

“Our ISO certification shows that Mission Critical Solutions meets the expected level of quality and standards for higher customer satisfaction,” CEO Bob McGowan said. “It puts MCS in the playing field with other ISO manufacturers.”

MCS has provided engineering and manufacturing services to the United States' armed forces, and to major freight and railroad companies in the U.S.

Customers range from a variety of industries including transportation, utilities, drilling, mining, the United States' military and heavy equipment companies.

MCS has completed work for protection systems for the San Francisco International Airport and the international airport in Moscow, Russia, through services with the international company, [Blastwall](#).

Founded in 2008 with four employees working in a 9,000 square foot facility, Mission Critical Solutions has grown to 50 employees and has expanded to a 50,000 square foot facility.

In 2012, MCS received its first ISO certification, and has renewed its ISO 9001:2008 through SRI, while maintaining a M-1003 certification through the [Association of American Railroads](#).

[SRI](#) is headquartered near Pittsburgh in Seven Fields, Pennsylvania, with regional offices in Birmingham, Alabama; Dublin, Ireland; and Osaka, Japan. ISO standards are developed by groups of experts from all over the world.

Mission Critical Solutions President George Bohrer said that the company's certification renewal differentiates MCS from a lot of standard fabrication shops.

“It demonstrates a higher level of quality control and customer satisfaction,” Bohrer said.

With more than 60 years' combined experience, MCS's team of engineers, AWS certified welders, and machinists provide faster results than some of the larger fabrication companies while still maintaining the high quality of other ISO certified manufacturers, McGowan said.

“We're able to take something from a drawing to a finished product a lot quicker,” he said. “That's the beauty of it.”
